

Proposed Solution

Project-level solution statement and value proposition

DATE	STUDENT NAME	PROJECT
07 October 2026	Gangadevi.R	Incident Life Cycle Automation

S.No.	Parameter	Project-specific Description
1	1. Problem to be solved	Make incident handling a single, traceable lifecycle instead of a collection of manual hand-offs.
2	2. Idea / Solution description	Build an Incident Life Cycle Automation system that captures incidents, applies triage rules, routes ownership, tracks SLA timers, triggers escalation, records resolution, supports closure and keeps an audit trail.
3	3. Novelty / Uniqueness	The value is the workflow automation itself: operational rules are embedded in the lifecycle so the next action can be triggered consistently without repeated manual follow-up.
4	4. Social Impact / Customer Satisfaction	Improves transparency for users, reduces avoidable waiting, gives support teams clearer ownership and creates a dependable history for incident review.
5	5. Business Model / Revenue Model	For an academic/project implementation, the primary objective is process improvement. In a real deployment, it could be offered as an internal operations platform or a subscription-based service depending on hosting and support scope.
6	6. Scalability of the Solution	The same lifecycle can support multiple teams, queues, priorities and SLA policies by separating workflow rules from core incident data.
