

# Solution Architecture

Layered architecture aligned to the incident lifecycle

|                 |              |                                |
|-----------------|--------------|--------------------------------|
| DATE            | STUDENT NAME | PROJECT                        |
| 07 October 2026 | Gangadevi.R  | Incident Life Cycle Automation |

The architecture keeps the user interface, lifecycle/business rules, persistent data and scheduled automation responsibilities separate so each part can evolve without rewriting the whole system.

## Key components

| Layer                    | Key responsibility                             | Project components                                                                     |
|--------------------------|------------------------------------------------|----------------------------------------------------------------------------------------|
| Presentation             | User interaction and visibility                | Incident intake, incident detail, dashboard, filters, role-based actions               |
| Application & Automation | Enforce lifecycle rules and automate decisions | Validation, triage, routing, status transitions, SLA timers, escalation, notifications |
| Data                     | Persist operational and audit information      | Incidents, users/roles, workflow rules, status history, audit log                      |
| Integration / Runtime    | Run scheduled work and deliver messages        | Scheduler/worker, email gateway, runtime/deployment                                    |
