

Define Problem Statements

Customer problem statements for the incident lifecycle

DATE	STUDENT NAME	PROJECT
07 October 2026	Gangadevi.R	Incident Life Cycle Automation

A strong problem statement is specific enough to guide the solution, but neutral enough not to prescribe a technology prematurely.

ID	I am	I am trying to	But	Because	Which makes me feel
PS-1	I am a reporter / end user	trying to raise an incident and get timely visibility	but the process can depend on manual follow-up	because intake and status updates are not consistently automated	which makes me feel uncertain about whether my issue is being handled.
PS-2	I am a support engineer	trying to resolve assigned incidents within SLA	but ownership, priority and updates can be fragmented	because routing and lifecycle tracking can require manual coordination	which makes me feel slowed down and reactive.
PS-3	I am an incident manager	trying to prevent SLA breaches and control incident flow	but escalation and follow-up can happen late	because monitoring and notifications are manual or disconnected	which makes me feel that operational risk is harder to control.
PS-4	I am an administrator / auditor	trying to review what happened to each incident	but evidence can be spread across messages and manual records	because the lifecycle is not captured in one auditable trail	which makes me feel that reporting and compliance checks take unnecessary effort.

Core problem Incidents are often managed as disconnected activities instead of one traceable, rule-driven lifecycle from intake to closure.
